## Amendment to the Abstract:

A data carrier (1) for contactless communication with a communication station has a substrate means (2) and a communication resonant circuit (3) connected to the substrate means (2) and consisting of a communication coil (4) and of a capacitor configuration (6) and having a resonant frequency  $(f_R)$  which should have a nominal value, changing <u>unit means</u> (9) for changing the resonant frequency  $(f_R)$  being provided, which changing <u>unit means</u> enable the resonant frequency  $(f_R)$  to be changed from an initial value both to higher frequency values and to lower freequency values.
